

ACCESSING TREATMENT FOR AMYLOIDOSIS

New, **innovative treatment options** can help patients with a rare condition called hATTR amyloidosis.

Patients can now be treated with infusions, injections, and oral medications.

And more innovation is coming.

But amyloidosis patients **can't always access** the treatment they need.

Some insurers:

Limit access through utilization management

Require excessive out-of-pocket costs

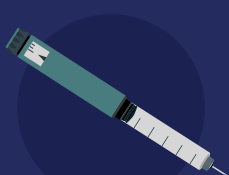

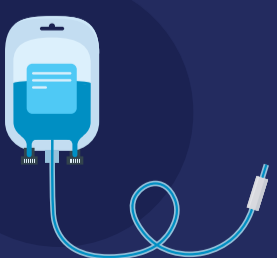

Refuse to cover treatment

Without the right medication, amyloidosis patients may experience **irreversible disease progression** or a decreased quality of life.

PATIENTS NEED ACCESS TO THE **FULL RANGE** OF TREATMENTS FOR hATTR AMYLOIDOSIS.
