

DEADLY DISPARITIES

in Heart Health

HCM, or hypertrophic cardiomyopathy, develops when the heart muscle thickens, making it difficult for blood to circulate.

THE CONDITION CAN BE **DEADLY.**

TREATMENTS ARE AVAILABLE, BUT THEY DON'T ALWAYS REACH PATIENTS.

That's because patients seldom detect symptoms, leaving the condition underdiagnosed.

PATIENTS OF COLOR FACE ADDITIONAL CHALLENGES.

Some patients of color are:

less likely to have **adequate insurance coverage.**

less likely to **access genetic testing** and treatment.

more likely to **experience heart failure** because of HCM.

EVERY HEART
DESERVES EQUAL
TREATMENT.
